

## Answers

### MULTIPLE-CHOICE QUESTIONS

1. C. The mean of the sampling distribution is equal to the mean of the population and the standard deviation of the sampling distribution is equal to the population standard deviation divided by the square root of the sample size
2. D. The average of \$372,000 is computed from a sample of 50 homes. A statistic is a quantity computed from values in a sample
3. B. The mean of the sampling distribution is equal to the mean of the population and the standard deviation of the sampling distribution is equal to the population standard deviation divided by the square root of the sample size
4. E. Any particular sample mean is not necessarily equal to the population mean. However, the sampling distribution of the sample mean will be approximately normal when the sample size is sufficiently large, as the Central Limit Theorem states. Dividing by the square root of  $n$  makes the standard deviation of the sampling distribution smaller as  $n$  gets larger.
5. C. The mean of the sampling distribution equals the mean of the population but the standard deviation of the sampling distribution will be smaller—it is the population standard deviation divided by the square root of the sample size
6. A. The Central Limit Theorem states that even in skewed populations, if the sample size,  $n$ , is sufficiently large (greater than 30), the sampling distribution will be approximately normal
7. E. The population mean and standard deviation are fixed and we don't expect the sample mean or the sample standard deviation to be exactly equal to  $\mu$  and  $\sigma$ . In fact, in many repeated samplings, we expect to get several different values for the sample mean and standard deviation. None of the three statements are true
8. A. The two standard errors are close to each other (0.000236 and 0.000244), since the proportions of those who were satisfied are very close to one another and the two sample sizes are the same
