"Integrated Environmental Modeling" provides broad-based training in the development

of pollutant transport and fate models in air, water, and soil. It focuses on five essential competencies: understanding the fundamental process principles that govern contaminant transport and transformations in multimedia environments, emphasizing the parallels and links between different media; learning model development skills, starting from the simplest conceptual models and building more complex and ...

Environmental Modeling: Fate and Transport of Pollutants ...

The fate of the emitted pollutants is largely determined by the source release characteristics. After pollutants are released to the atmosphere, their transport, dispersion, and transformation are governed by meteorological principles, terrain characteristics, wet and dry deposition rates, and certain chemical properties of the air pollutant (such as aqueous solubility, vapor pressure, air-water partition coefficient (i.e., Henry's Law constant), molecular diffusivity, phase partition ...

Integrated Environmental Modeling: Pollutant Transport ...

Contaminant fate and transport modeling provides a mechanism to synthesize the various environmental characteristics and parameters for a site to develop a robust conceptual site model. The model can be used to understand a site's history, as well as forecast the impact of various remediation approaches or water-supply options.

Soil contamination is an issue of paramount importance to assess human health (HHRA) as well as ecological (ERA) risk assessment. To analyze risk scenarios related to contaminated soils, the identification of sources, either of primary or secondary type, as well as the assessment of propagation and fate processes is needed. Although many studies refer to the transport of pollutants in fully ...
