### CHAPTER 3 DESIGN OF PRODUCTS AND SERVICES

#### Discussion Questions

1. Describe the generic product development process described in this chapter. How does this process change for technology push products?

*Products that are developed using the "technology push" would be more narrowly focused in phase 0 and phase 1 of Marketing. The focus would be narrower because you would only look at market segments that could benefit from the application of your technology. The rest of the generic process may be somewhat less complex as well since the technology of the product currently exists in your manufacturing facilities*

2. How does the QFD approach help? What are some limitations of this approach?

*QFD helps to get the voice of the customer into the design process using interfunctional teams. The limitations of QFD relate to the culture of the organization. In the United States, we tend to be vertically oriented and try to promote breakthrough. This can work against interfunctional teamwork, which is needed for QFD success. If a breakthrough culture can be maintained with a continuous improvement mentality through interfunctional teams, this would lead to tremendous improvements in productivity.*

3. Discuss the product design philosophy behind industrial design and design for manufacture and assembly. Which one do you think is more important in a customer-focused product development?

*Industrial design is concerned with designing a product from the end-user's point of view, such as aesthetics and user-friendliness of the product. Design for manufacturability, on the other hand, makes the product design less complicated and easier to manufacture. Very often it results in fewer parts, smaller size, increased reliability, and lower cost.*
